CBI CASE STUDY - New Bedford Waste Services, LLC, New Bedford, MA

New Bedford Waste Services was created by Mike Camara, President of ABC Disposal Service, to comply with new restrictions and to continue to lead in the business of waste processing. In 2002, Camara contacted CBI requesting the assistance in building a waste-processing facility for the new company. Together, Camara and CBI designed and built a system that is not only efficient, but extremely flexible. The primary shredder has the capability to modify the product size by changing the anvil setting. The shredded material then passes over the primary vibratory Taper-Slot Screen to separate the 6" minus material. The 6" material then goes over a secondary screen to remove the 2" fines. The remaining material goes onto a picking conveyor for further sorting. The 6"+ also goes into the picking room for recovery of the recyclables. The overs then can either go to a water tank or directly into the large vertical feed grinder. The system has a great deal of flexibility designed in to provide the agility to adapt to markets that continually change in response to new regulations.
