CBI CASE STUDY - SBRC, Inc., Vaucluse, St. Thomas, Barbados

SBRC is a company started by the Caribbean Island of Barbados because their landfill was becoming an environmental problem. They knew that they needed a system that could do a little bit of everything, so they contacted CBI. This system had to be designed, not only to process C&D, but also, to process the contaminated soils coming into the landfill. CBI went and sat down with their engineers and designed a system that met all their needs for both products and one that would keep their costs down. It consists of the C&D system line with Action Screen and a large sorting line for picking out the recyclables. An aggregate line is included to screen and separate out the different size soils and remove the contamination from the overs. It also has a CBI 6400 Magnum Force grinder for grinding some of the C&D and all the wood waste from both of the lines. This system is scheduled to start up in January 2009.
