CBI CASE STUDY - Shamrock Disposal and Recycling, Blaine, MN

Shamrock Disposal and Recycling was established in 1997 as a hauler. Soon, the owners decided to become more “green” and begin recycling C&D material. At first, they started out with a simple system that served its purpose of helping them develop their markets. Then, they contacted CBI to design and build a system to meet growing demands of their company. CBI was challenged with designing a system to fit inside their existing 20,000 sq./ft. facility and that would produce ADC at 3/4”. Meeting these application requirements was made easier by the breadth of CBI’s diverse line of grinders. The resulting system is equipped with Primary Shredder, Picking Table, Wood Conveyors, two Grizzly Mills and a Vibra Snap Screen. This system is designed for easy removal of recyclables and for the grinding of residuals to a 3/4” minus for ADC.
